

Yes. Here is the plain answer.

You do not need to collect everything yourself. I can fetch and work with the public official sources on my own for the core project. The sources I can pull from are: CGWB Bihar groundwater yearbooks and water-level datasets, Bihar HMIS district-monthly indicators on data.gov.in, NFHS-5 Bihar fact sheets from IIPS, and Bihar district census handbooks from Census India. CGWB's monitoring page says Bihar yearbooks are downloadable and that water-level data are compiled from 1994 onward; data.gov.in has Bihar HMIS district-level monthly catalogs; IIPS hosts NFHS-5 state/UT fact sheets; and Census India hosts Bihar district handbooks.

What I need from your side is only this:

1. **Your final choice of outcome**

I recommend we use a data-rich health outcome, like monthly district health burden from HMIS, because it gives us a real multi-year training set. If you still want a nutrition outcome, we can use NFHS-5, but that is mostly a survey snapshot, not a long time series.

2. **Any files you already have**

If you already downloaded PDFs, CSVs, Excel files, or shapefiles, send them. That will save time.

3. **Your preferred geography**

District level is easiest and strongest. Block level is possible only if the source data actually exists at that detail.

4. **Your preferred time span**

If you do not choose one, I will use the longest reliable public window available from the official sources.

What I can do on my own:

- download public CGWB Bihar groundwater files and extract the tables,
- pull Bihar HMIS monthly district indicators from the OGD portal,
- pull NFHS-5 Bihar fact sheets,
- pull Census Bihar district handbook data,
- clean, merge, and structure the final dataset for modeling.

What I cannot reliably do without your help:

- anything that is behind a login, blocked download, or manual file gate,
- any file that is only visible as an image or badly scanned PDF unless you upload it,
- any source you already have locally but I cannot reach from the web.

So the simplest setup is this: **you only send me whatever you already have; I will fetch the rest from official public sources.**
